Contents

<i>Preface to the Second Edition</i>	<i>xvii</i>
<i>From the Preface to the First Edition</i>	<i>xxiii</i>
 <i>Part I Background</i>	
<i>1 Motivation</i>	<i>3</i>
<i>1.1 Need for numerical methods</i>	<i>4</i>
<i>1.2 Need for numerical computing environments: why MATLAB?</i>	<i>9</i>
<i>1.3 Need for theory</i>	<i>13</i>
<i>For further reading</i>	<i>20</i>
<i>References</i>	<i>21</i>
 <i>2 Financial Theory</i>	 <i>23</i>
<i>2.1 Modeling uncertainty</i>	<i>25</i>
<i>2.2 Basic financial assets and related issues</i>	<i>30</i>
<i>2.2.1 Bonds</i>	<i>30</i>
<i>2.2.2 Stocks</i>	<i>31</i>

2.2.3	<i>Derivatives</i>	33
2.2.4	<i>Asset pricing, portfolio optimization, and risk management</i>	37
2.3	<i>Fixed-income securities: analysis and portfolio immunization</i>	42
2.3.1	<i>Basic theory of interest rates: compounding and present value</i>	42
2.3.2	<i>Basic pricing of fixed-income securities</i>	49
2.3.3	<i>Interest rate sensitivity and bond portfolio immunization</i>	57
2.3.4	<i>MATLAB functions to deal with fixed-income securities</i>	60
2.3.5	<i>Critique</i>	64
2.4	<i>Stock portfolio optimization</i>	65
2.4.1	<i>Utility theory</i>	66
2.4.2	<i>Mean-variance portfolio optimization</i>	73
2.4.3	<i>MATLAB functions to deal with mean-variance portfolio optimization</i>	74
2.4.4	<i>Critical remarks</i>	81
2.4.5	<i>Alternative risk measures: Value at Risk and quantile-based measures</i>	83
2.5	<i>Modeling the dynamics of asset prices</i>	88
2.5.1	<i>From discrete to continuous time</i>	88
2.5.2	<i>Standard Wiener process</i>	91
2.5.3	<i>Stochastic integrals and stochastic differential equations</i>	93
2.5.4	<i>Ito's lemma</i>	96
2.5.5	<i>Generalizations</i>	100
2.6	<i>Derivatives pricing</i>	102
2.6.1	<i>Simple binomial model for option pricing</i>	105
2.6.2	<i>Black–Scholes model</i>	108
2.6.3	<i>Risk-neutral expectation and Feynman–Kač formula</i>	111
2.6.4	<i>Black–Scholes model in MATLAB</i>	113
2.6.5	<i>A few remarks on Black–Scholes formula</i>	116
2.6.6	<i>Pricing American options</i>	117
2.7	<i>Introduction to exotic and path-dependent options</i>	118
2.7.1	<i>Barrier options</i>	119
2.7.2	<i>Asian options</i>	123
2.7.3	<i>Lookback options</i>	123

2.8	<i>An outlook on interest-rate derivatives</i>	124
2.8.1	<i>Modeling interest-rate dynamics</i>	126
2.8.2	<i>Incomplete markets and the market price of risk</i>	127
	<i>For further reading</i>	130
	<i>References</i>	131

Part II Numerical Methods

3	<i>Basics of Numerical Analysis</i>	137
3.1	<i>Nature of numerical computation</i>	138
3.1.1	<i>Number representation, rounding, and truncation</i>	138
3.1.2	<i>Error propagation, conditioning, and instability</i>	141
3.1.3	<i>Order of convergence and computational complexity</i>	143
3.2	<i>Solving systems of linear equations</i>	145
3.2.1	<i>Vector and matrix norms</i>	146
3.2.2	<i>Condition number for a matrix</i>	149
3.2.3	<i>Direct methods for solving systems of linear equations</i>	154
3.2.4	<i>Tridiagonal matrices</i>	159
3.2.5	<i>Iterative methods for solving systems of linear equations</i>	160
3.3	<i>Function approximation and interpolation</i>	173
3.3.1	<i>Ad hoc approximation</i>	177
3.3.2	<i>Elementary polynomial interpolation</i>	179
3.3.3	<i>Interpolation by cubic splines</i>	183
3.3.4	<i>Theory of function approximation by least squares</i>	188
3.4	<i>Solving non-linear equations</i>	191
3.4.1	<i>Bisection method</i>	192
3.4.2	<i>Newton's method</i>	195
3.4.3	<i>Optimization-based solution of non-linear equations</i>	198
3.4.4	<i>Putting two things together: solving a functional equation by a collocation method</i>	204

3.4.5	<i>Homotopy continuation methods</i>	204
	<i>For further reading</i>	206
	<i>References</i>	207
4	<i>Numerical Integration: Deterministic and Monte Carlo Methods</i>	209
4.1	<i>Deterministic quadrature</i>	211
4.1.1	<i>Classical interpolatory formulas</i>	212
4.1.2	<i>Gaussian quadrature</i>	214
4.1.3	<i>Extensions and product rules</i>	219
4.1.4	<i>Numerical integration in MATLAB</i>	220
4.2	<i>Monte Carlo integration</i>	221
4.3	<i>Generating pseudorandom variates</i>	225
4.3.1	<i>Generating pseudorandom numbers</i>	226
4.3.2	<i>Inverse transform method</i>	230
4.3.3	<i>Acceptance–rejection method</i>	233
4.3.4	<i>Generating normal variates by the polar approach</i>	235
4.4	<i>Setting the number of replications</i>	240
4.5	<i>Variance reduction techniques</i>	244
4.5.1	<i>Antithetic sampling</i>	244
4.5.2	<i>Common random numbers</i>	251
4.5.3	<i>Control variates</i>	252
4.5.4	<i>Variance reduction by conditioning</i>	255
4.5.5	<i>Stratified sampling</i>	260
4.5.6	<i>Importance sampling</i>	261
4.6	<i>Quasi-Monte Carlo simulation</i>	267
4.6.1	<i>Generating Halton low-discrepancy sequences</i>	269
4.6.2	<i>Generating Sobol low-discrepancy sequences</i>	281
	<i>For further reading</i>	286
	<i>References</i>	287
5	<i>Finite Difference Methods for Partial Differential Equations</i>	289
5.1	<i>Introduction and classification of PDEs</i>	290
5.2	<i>Numerical solution by finite difference methods</i>	293
5.2.1	<i>Bad example of a finite difference scheme</i>	295

5.2.2	<i>Instability in a finite difference scheme</i>	297
5.3	<i>Explicit and implicit methods for the heat equation</i>	303
5.3.1	<i>Solving the heat equation by an explicit method</i>	304
5.3.2	<i>Solving the heat equation by a fully implicit method</i>	309
5.3.3	<i>Solving the heat equation by the Crank–Nicolson method</i>	313
5.4	<i>Solving the bidimensional heat equation</i>	314
5.5	<i>Convergence, consistency, and stability</i>	320
	<i>For further reading</i>	324
	<i>References</i>	324
6	<i>Convex Optimization</i>	327
6.1	<i>Classification of optimization problems</i>	328
6.1.1	<i>Finite- vs. infinite-dimensional problems</i>	328
6.1.2	<i>Unconstrained vs. constrained problems</i>	333
6.1.3	<i>Convex vs. non-convex problems</i>	333
6.1.4	<i>Linear vs. non-linear problems</i>	335
6.1.5	<i>Continuous vs. discrete problems</i>	337
6.1.6	<i>Deterministic vs. stochastic problems</i>	337
6.2	<i>Numerical methods for unconstrained optimization</i>	338
6.2.1	<i>Steepest descent method</i>	339
6.2.2	<i>The subgradient method</i>	340
6.2.3	<i>Newton and the trust region methods</i>	341
6.2.4	<i>No-derivatives algorithms: quasi-Newton method and simplex search</i>	342
6.2.5	<i>Unconstrained optimization in MATLAB</i>	343
6.3	<i>Methods for constrained optimization</i>	346
6.3.1	<i>Penalty function approach</i>	346
6.3.2	<i>Kuhn–Tucker conditions</i>	351
6.3.3	<i>Duality theory</i>	357
6.3.4	<i>Kelley’s cutting plane algorithm</i>	363
6.3.5	<i>Active set method</i>	365
6.4	<i>Linear programming</i>	366
6.4.1	<i>Geometric and algebraic features of linear programming</i>	368
6.4.2	<i>Simplex method</i>	370

6.4.3	<i>Duality in linear programming</i>	372
6.4.4	<i>Interior point methods</i>	375
6.5	<i>Constrained optimization in MATLAB</i>	377
6.5.1	<i>Linear programming in MATLAB</i>	378
6.5.2	<i>A trivial LP model for bond portfolio management</i>	380
6.5.3	<i>Using quadratic programming to trace efficient portfolio frontier</i>	383
6.5.4	<i>Non-linear programming in MATLAB</i>	385
6.6	<i>Integrating simulation and optimization</i>	387
S6.1	<i>Elements of convex analysis</i>	389
S6.1.1	<i>Convexity in optimization</i>	389
S6.1.2	<i>Convex polyhedra and polytopes</i>	393
	<i>For further reading</i>	396
	<i>References</i>	397

Part III Pricing Equity Options

7	<i>Option Pricing by Binomial and Trinomial Lattices</i>	401
7.1	<i>Pricing by binomial lattices</i>	402
7.1.1	<i>Calibrating a binomial lattice</i>	403
7.1.2	<i>Putting two things together: pricing a pay-later option</i>	410
7.1.3	<i>An improved implementation of binomial lattices</i>	411
7.2	<i>Pricing American options by binomial lattices</i>	414
7.3	<i>Pricing bidimensional options by binomial lattices</i>	417
7.4	<i>Pricing by trinomial lattices</i>	422
7.5	<i>Summary</i>	425
	<i>For further reading</i>	426
	<i>References</i>	426
8	<i>Option Pricing by Monte Carlo Methods</i>	429
8.1	<i>Path generation</i>	430
8.1.1	<i>Simulating geometric Brownian motion</i>	431
8.1.2	<i>Simulating hedging strategies</i>	435
8.1.3	<i>Brownian bridge</i>	439
8.2	<i>Pricing an exchange option</i>	443

8.3	<i>Pricing a down-and-out put option</i>	446
8.3.1	<i>Crude Monte Carlo</i>	446
8.3.2	<i>Conditional Monte Carlo</i>	447
8.3.3	<i>Importance sampling</i>	450
8.4	<i>Pricing an arithmetic average Asian option</i>	454
8.4.1	<i>Control variates</i>	455
8.4.2	<i>Using Halton sequences</i>	458
8.5	<i>Estimating Greeks by Monte Carlo sampling</i>	468
	<i>For further reading</i>	472
	<i>References</i>	473
9	<i>Option Pricing by Finite Difference Methods</i>	475
9.1	<i>Applying finite difference methods to the Black–Scholes equation</i>	475
9.2	<i>Pricing a vanilla European option by an explicit method</i>	478
9.2.1	<i>Financial interpretation of the instability of the explicit method</i>	481
9.3	<i>Pricing a vanilla European option by a fully implicit method</i>	482
9.4	<i>Pricing a barrier option by the Crank–Nicolson method</i>	485
9.5	<i>Dealing with American options</i>	486
	<i>For further reading</i>	491
	<i>References</i>	491
 <i>Part IV Advanced Optimization Models and Methods</i>		
10	<i>Dynamic Programming</i>	495
10.1	<i>The shortest path problem</i>	496
10.2	<i>Sequential decision processes</i>	500
10.2.1	<i>The optimality principle and solving the functional equation</i>	501
10.3	<i>Solving stochastic decision problems by dynamic programming</i>	504
10.4	<i>American option pricing by Monte Carlo simulation</i>	511
10.4.1	<i>A MATLAB implementation of the least squares approach</i>	517

10.4.2	<i>Some remarks and alternative approaches</i>	519
	<i>For further reading</i>	521
	<i>References</i>	522
11	<i>Linear Stochastic Programming Models with Recourse</i>	525
11.1	<i>Linear stochastic programming models</i>	526
11.2	<i>Multistage stochastic programming models for portfolio management</i>	530
11.2.1	<i>Split-variable model formulation</i>	532
11.2.2	<i>Compact model formulation</i>	540
11.2.3	<i>Asset and liability management with transaction costs</i>	544
11.3	<i>Scenario generation for multistage stochastic programming</i>	546
11.3.1	<i>Sampling for scenario tree generation</i>	547
11.3.2	<i>Arbitrage free scenario generation</i>	550
11.4	<i>L-shaped method for two-stage linear stochastic programming</i>	555
11.5	<i>A comparison with dynamic programming</i>	558
	<i>For further reading</i>	559
	<i>References</i>	560
12	<i>Non-Convex Optimization</i>	563
12.1	<i>Mixed-integer programming models</i>	564
12.1.1	<i>Modeling with logical variables</i>	565
12.1.2	<i>Mixed-integer portfolio optimization models</i>	571
12.2	<i>Fixed-mix model based on global optimization</i>	576
12.3	<i>Branch and bound methods for non-convex optimization</i>	578
12.3.1	<i>LP-based branch and bound for MILP models</i>	584
12.4	<i>Heuristic methods for non-convex optimization</i>	591
	<i>For further reading</i>	597
	<i>References</i>	598

Part V Appendices

<i>Appendix A Introduction to MATLAB Programming</i>	<i>603</i>
<i>A.1 MATLAB environment</i>	<i>603</i>
<i>A.2 MATLAB graphics</i>	<i>614</i>
<i>A.3 MATLAB programming</i>	<i>616</i>
<i>Appendix B Refresher on Probability Theory and Statistics</i>	<i>623</i>
<i>B.1 Sample space, events, and probability</i>	<i>623</i>
<i>B.2 Random variables, expectation, and variance</i>	<i>625</i>
<i>B.2.1 Common continuous random variables</i>	<i>628</i>
<i>B.3 Jointly distributed random variables</i>	<i>632</i>
<i>B.4 Independence, covariance, and conditional expectation</i>	<i>633</i>
<i>B.5 Parameter estimation</i>	<i>637</i>
<i>B.6 Linear regression</i>	<i>642</i>
<i>For further reading</i>	<i>645</i>
<i>References</i>	<i>645</i>
<i>Appendix C Introduction to AMPL</i>	<i>647</i>
<i>C.1 Running optimization models in AMPL</i>	<i>648</i>
<i>C.2 Mean variance efficient portfolios in AMPL</i>	<i>649</i>
<i>C.3 The knapsack model in AMPL</i>	<i>652</i>
<i>C.4 Cash flow matching</i>	<i>655</i>
<i>For further reading</i>	<i>655</i>
<i>References</i>	<i>656</i>
<i>Index</i>	<i>657</i>
