

Python Scripting for Computational Science

Hans Petter Langtangen

Simula Research Laboratory

and

Department of Informatics
University of Oslo

Table of Contents

1	Introduction	1
1.1	Scripting versus Traditional Programming	1
1.1.1	Why Scripting is Useful in Computational Science	2
1.1.2	Classification of Programming Languages	4
1.1.3	Productive Pairs of Programming Languages	5
1.1.4	Gluing Existing Applications	6
1.1.5	Scripting Yields Shorter Code	7
1.1.6	Efficiency	8
1.1.7	Type-Specification (Declaration) of Variables	9
1.1.8	Flexible Function Interfaces	11
1.1.9	Interactive Computing	12
1.1.10	Creating Code at Run Time	13
1.1.11	Nested Heterogeneous Data Structures	14
1.1.12	GUI Programming	16
1.1.13	Mixed Language Programming	17
1.1.14	When to Choose a Dynamically Typed Language	19
1.1.15	Why Python?	20
1.1.16	Script or Program?	21
1.2	Preparations for Working with This Book	22
2	Getting Started with Python Scripting	27
2.1	A Scientific Hello World Script	27
2.1.1	Executing Python Scripts	28
2.1.2	Dissection of the Scientific Hello World Script	29
2.2	Reading and Writing Data Files	32
2.2.1	Problem Specification	32
2.2.2	The Complete Code	33
2.2.3	Dissection	33
2.2.4	Working with Files in Memory	36
2.2.5	Efficiency Measurements	37
2.2.6	Exercises	38
2.3	Automating Simulation and Visualization	40
2.3.1	The Simulation Code	41
2.3.2	Using Gnuplot to Visualize Curves	43
2.3.3	Functionality of the Script	44
2.3.4	The Complete Code	45
2.3.5	Dissection	47
2.3.6	Exercises	49
2.4	Conducting Numerical Experiments	52
2.4.1	Wrapping a Loop Around Another Script	53

2.4.2	Generating an HTML Report	54
2.4.3	Making Animations	56
2.4.4	Varying Any Parameter	57
2.4.5	Exercises	60
2.5	File Format Conversion	60
2.5.1	The First Version of the Script	61
2.5.2	The Second Version of the Script	62
3	Basic Python	65
3.1	Introductory Topics	65
3.1.1	Recommended Python Documentation	65
3.1.2	Testing Statements in the Interactive Shell	67
3.1.3	Control Statements	68
3.1.4	Running an Application	69
3.1.5	File Reading and Writing	70
3.1.6	Output Formatting	72
3.1.7	Exercises	73
3.2	Variables of Different Types	74
3.2.1	Boolean Types	74
3.2.2	The None Variable	75
3.2.3	Numbers and Numerical Expressions	76
3.2.4	Lists and Tuples	78
3.2.5	Dictionaries	84
3.2.6	Splitting and Joining Text	87
3.2.7	String Operations	88
3.2.8	Text Processing	89
3.2.9	The Basics of a Python Class	91
3.2.10	Determining a Variable's Type	93
3.2.11	Exercises	96
3.3	Functions	101
3.3.1	Keyword Arguments	102
3.3.2	Doc Strings	103
3.3.3	Variable Number of Arguments	103
3.3.4	Call by Reference	104
3.3.5	Treatment of Input and Output Arguments	106
3.3.6	Function Objects	107
3.4	Working with Files and Directories	108
3.4.1	Listing Files in a Directory	109
3.4.2	Testing File Types	109
3.4.3	Copying and Renaming Files	110
3.4.4	Removing Files and Directories	111
3.4.5	Splitting Pathnames	111
3.4.6	Creating and Moving to Directories	112
3.4.7	Traversing Directory Trees	112
3.4.8	Exercises	115

4 Numerical Computing in Python	121
4.1 A Quick NumPy Primer	123
4.1.1 Creating Arrays	123
4.1.2 Array Indexing	124
4.1.3 Array Computations	126
4.1.4 Type Testing	127
4.1.5 Hidden Temporary Arrays	129
4.1.6 Exercises	130
4.2 Vectorized Algorithms	131
4.2.1 Arrays as Function Arguments	132
4.2.2 Slicing	133
4.2.3 Remark on Efficiency	134
4.2.4 Exercises	136
4.3 More Advanced Array Computing	137
4.3.1 Random Numbers	137
4.3.2 Linear Algebra	139
4.3.3 The Gnuplot Module	139
4.3.4 Example: Curve Fitting	142
4.3.5 Arrays on Structured Grids	144
4.3.6 File I/O with NumPy Arrays	146
4.3.7 Reading and Writing Tables with NumPy Arrays	147
4.3.8 Functionality in the Numpytools Module	150
4.3.9 Exercises	152
4.4 Other Tools for Numerical Computations	156
4.4.1 The ScientificPython Package	156
4.4.2 The SciPy Package	161
4.4.3 The Python–Matlab Interface	165
4.4.4 Some Useful Python Modules	166
4.5 A Database for NumPy Arrays	167
4.5.1 The Structure of the Database	168
4.5.2 Pickling	170
4.5.3 Formatted ASCII Storage	171
4.5.4 Shelving	172
4.5.5 Comparing the Various Techniques	173
5 Combining Python with Fortran, C, and C++	175
5.1 About Mixed Language Programming	175
5.1.1 Applications of Mixed Language Programming	176
5.1.2 Calling C from Python	176
5.1.3 Automatic Generation of Wrapper Code	178
5.2 Scientific Hello World Examples	180
5.2.1 Combining Python and Fortran	181
5.2.2 Combining Python and C	186
5.2.3 Combining Python and C++ Functions	192
5.2.4 Combining Python and C++ Classes	194

5.2.5	Exercises	198
5.3	A Simple Computational Steering Example	198
5.3.1	Modified Time Loop for Repeated Simulations	199
5.3.2	Creating a Python Interface	200
5.3.3	The Steering Python Script	202
5.3.4	Equipping the Steering Script with a GUI	205
5.4	Scripting Interfaces to Large Libraries	207
6	Introduction to GUI Programming	211
6.1	Scientific Hello World GUI	211
6.1.1	Introductory Topics	211
6.1.2	The First Python/Tkinter Encounter	214
6.1.3	Binding Events	217
6.1.4	Changing the Layout	218
6.1.5	The Final Scientific Hello World GUI	223
6.1.6	An Alternative to Tkinter Variables	224
6.1.7	About the Pack Command	225
6.1.8	An Introduction to the Grid Geometry Manager	227
6.1.9	Implementing a GUI as a Class	229
6.1.10	A Simple Graphical Function Evaluator	231
6.1.11	Exercises	233
6.2	Adding GUIs to Scripts	235
6.2.1	A Simulation and Visualization Script with a GUI	235
6.2.2	Improving the Layout	238
6.2.3	Exercises	241
6.3	A List of Common Widget Operations	242
6.3.1	Frame	245
6.3.2	Label	245
6.3.3	Button	247
6.3.4	Text Entry	247
6.3.5	Balloon Help	249
6.3.6	Option Menu	250
6.3.7	Slider	250
6.3.8	Check Button	251
6.3.9	Making a Simple Megawidget	251
6.3.10	Menu Bar	252
6.3.11	List Data	254
6.3.12	Listbox	255
6.3.13	Radio Button	258
6.3.14	Combo Box	259
6.3.15	Message Box	260
6.3.16	User-Defined Dialogs	262
6.3.17	Color-Picker Dialogs	263
6.3.18	File Selection Dialogs	266
6.3.19	Toplevel	267

6.3.20	Some Other Types of Widgets	268
6.3.21	Adapting Widgets to the User's Resize Actions	269
6.3.22	Customizing Fonts and Colors	271
6.3.23	Widget Overview	273
6.3.24	Exercises	275
7	Web Interfaces and CGI Programming	281
7.1	Introductory CGI Scripts	282
7.1.1	Web Forms and CGI Scripts	283
7.1.2	Generating Forms in CGI Scripts	285
7.1.3	Debugging CGI Scripts	287
7.1.4	Security Issues	289
7.1.5	A General Shell Script Wrapper for CGI Scripts	290
7.2	Making a Web Interface to a Script	292
7.2.1	A Class for Form Parameters	292
7.2.2	Calling Other Programs	295
7.2.3	Running Simulations	296
7.2.4	Getting a CGI Script to Work	297
7.2.5	Using Web Services from Scripts	300
7.2.6	Exercises	302
8	Advanced Python	305
8.1	Miscellaneous Topics	305
8.1.1	Parsing Command-Line Arguments	305
8.1.2	Platform-Dependent Operations	308
8.1.3	Run-Time Generation of Code	309
8.1.4	Exercises	310
8.2	Regular Expressions and Text Processing	311
8.2.1	Motivation	312
8.2.2	Special Characters	315
8.2.3	Regular Expressions for Real Numbers	316
8.2.4	Using Groups to Extract Parts of a Text	320
8.2.5	Extracting Interval Limits	320
8.2.6	Extracting Multiple Matches	325
8.2.7	Splitting Text	329
8.2.8	Pattern-Matching Modifiers	330
8.2.9	Substitution and Backreferences	333
8.2.10	Example: Swapping Arguments in Function Calls	333
8.2.11	A General Substitution Script	337
8.2.12	Debugging Regular Expressions	338
8.2.13	Exercises	340
8.3	Tools for Handling Data in Files	350
8.3.1	Writing and Reading Python Data Structures	350
8.3.2	Pickling Objects	352
8.3.3	Shelving Objects	354

XIV Table of Contents

8.3.4	Writing and Reading Zip Archive Files	355
8.3.5	Downloading Internet Files.....	356
8.3.6	Binary Input/Output	357
8.3.7	Exercises	359
8.4	Scripts Involving Local and Remote Hosts	359
8.4.1	Secure Shell Commands	360
8.4.2	Distributed Simulation and Visualization	361
8.4.3	Client/Server Programming	363
8.4.4	Threads	363
8.5	Classes	365
8.5.1	Class Programming	365
8.5.2	Checking the Class Type	369
8.5.3	Private Data	370
8.5.4	Static Data	370
8.5.5	Special Attributes	371
8.5.6	Special Methods	371
8.5.7	Multiple Inheritance	373
8.5.8	Using a Class as a C-like Structure	373
8.5.9	Attribute Access via String Names	374
8.5.10	Example: Turning String Formulas into Functions	375
8.5.11	Example: Class for Structured Grids	376
8.5.12	New-Style Classes	379
8.5.13	Implementing Get/Set Functions via Properties	379
8.5.14	Subclassing Built-in Types	381
8.5.15	Copy and Assignment	383
8.5.16	Building Class Interfaces at Run Time	386
8.5.17	Building Flexible Class Interfaces	389
8.5.18	Exercises	396
8.6	Scope of Variables	399
8.6.1	Global, Local, and Class Variables	399
8.6.2	Nested Functions	401
8.6.3	Dictionaries of Variables in Namespaces	402
8.7	Exceptions	404
8.7.1	Handling Exceptions	405
8.7.2	Raising Exceptions	406
8.8	Iterators	407
8.8.1	Constructing an Iterator	407
8.8.2	A Pointwise Grid Iterator	409
8.8.3	A Vectorized Grid Iterator	413
8.8.4	Generators	415
8.8.5	Some Aspects of Generic Programming	417
8.9	Investigating Efficiency	421
8.9.1	CPU-Time Measurements	421
8.9.2	Profiling Python Scripts	424
8.9.3	Optimization of Python Code	425

9 Fortran Programming with NumPy Arrays	429
9.1 Problem Definition	429
9.2 Filling an Array in Fortran	432
9.2.1 The Fortran Subroutine	432
9.2.2 Building and Inspecting the Extension Module	433
9.3 Array Storage Issues	435
9.3.1 Generating an Erroneous Interface	435
9.3.2 Array Storage in C and Fortran	437
9.3.3 Input and Output Arrays as Function Arguments	438
9.3.4 F2PY Interface Files	444
9.3.5 Hiding Work Arrays	448
9.4 Increasing Callback Efficiency	449
9.4.1 Callbacks to Vectorized Python Functions	449
9.4.2 Avoiding Callbacks to Python	452
9.4.3 Compiled Inline Callback Functions	453
9.5 Summary	456
9.6 Exercises	456
9.6.1 Exercises	456
10 C and C++ Programming with NumPy Arrays	461
10.1 C Programming with NumPy Arrays	462
10.1.1 Basics of the NumPy C API	462
10.1.2 The Handwritten Extension Code	464
10.1.3 Sending Arguments from Python to C	465
10.1.4 Consistency Checks	466
10.1.5 Computing Array Values	467
10.1.6 Returning an Output Array	469
10.1.7 Convenient Macros	470
10.1.8 Module Initialization	471
10.1.9 Extension Module Template	472
10.1.10 Compiling, Linking, and Debugging the Module	474
10.1.11 Writing a Wrapper for a C Function	475
10.2 C++ Programming with NumPy Arrays	478
10.2.1 Wrapping a NumPy Array in a C++ Object	479
10.2.2 Using SCXX	481
10.2.3 NumPy-C++ Class Conversion	483
10.3 Comparison of the Implementations	492
10.3.1 Efficiency	492
10.3.2 Error Handling	495
10.3.3 Summary	496
10.3.4 Exercises	497

11 More Advanced GUI Programming	503
11.1 Adding Plot Areas in GUIs	503
11.1.1 The BLT Graph Widget	504
11.1.2 Animation of Functions in BLT Graph Widgets	510
11.1.3 Other Tools for Making GUIs with Plots	512
11.1.4 Exercises	514
11.2 Event Bindings	517
11.2.1 Binding Events to Functions with Arguments	517
11.2.2 A Text Widget with Tailored Keyboard Bindings	520
11.2.3 A Fancy List Widget	523
11.3 Animated Graphics with Canvas Widgets	526
11.3.1 The First Canvas Encounter	527
11.3.2 Coordinate Systems	528
11.3.3 The Mathematical Model Class	532
11.3.4 The Planet Class	533
11.3.5 Drawing and Moving Planets	535
11.3.6 Dragging Planets to New Positions	536
11.3.7 Using Pmw's Scrolled Canvas Widget	540
11.4 Tools for Simulation & Visualization Scripts	542
11.4.1 Restructuring the Script	543
11.4.2 Representing a Parameter by a Class	545
11.4.3 Improved Command-Line Script	559
11.4.4 Improved GUI Script	560
11.4.5 Improved CGI Script	561
11.4.6 Parameters with Physical Dimensions	562
11.4.7 Adding a Curve Plot Area	564
11.4.8 Automatic Generation of Scripts	566
11.4.9 Applications of the Tools	567
11.4.10 Allowing Physical Units in Input Files	572
11.4.11 Converting Input Files to GUIs	576
12 Tools and Examples	579
12.1 Running Series of Computer Experiments	579
12.1.1 Multiple Values of Input Parameters	580
12.1.2 Implementation Details	583
12.1.3 Further Applications	588
12.2 Tools for Representing Functions	592
12.2.1 Functions Defined by String Formulas	592
12.2.2 A Unified Interface to Functions	594
12.2.3 Interactive Drawing of Functions	600
12.2.4 A Notebook for Selecting Functions	606
12.3 Solving Partial Differential Equations	612
12.3.1 Numerical Methods for 1D Wave Equations	613
12.3.2 Implementations of 1D Wave Equations	616
12.3.3 Classes for Solving 1D Wave Equations	622

12.3.4 A Problem Solving Environment	629
12.3.5 Numerical Methods for 2D Wave Equations	635
12.3.6 Implementations of 2D Wave Equations	638
A Setting up the Required Software Environment	649
A.1 Installation on Unix Systems	649
A.1.1 A Suggested Directory Structure	650
A.1.2 Setting Some Environment Variables	650
A.1.3 Installing Tcl/Tk and Additional Modules	651
A.1.4 Installing Python	652
A.1.5 Installing Python Modules	654
A.1.6 Installing Gnuplot	658
A.1.7 Installing SWIG	658
A.1.8 Summary of Environment Variables	659
A.1.9 Testing the Installation of Scripting Utilities	659
A.2 Installation on Windows Systems	660
B Elements of Software Engineering	665
B.1 Building and Using Modules	665
B.1.1 Single-File Modules	665
B.1.2 Multi-File Modules	668
B.1.3 Debugging and Troubleshooting	670
B.2 Tools for Documenting Python Software	672
B.2.1 Doc Strings	673
B.2.2 Tools for Automatic Documentation	674
B.3 Coding Standards	678
B.3.1 Style Guide	678
B.3.2 Pythonic Programming	682
B.4 Verification of Scripts	687
B.4.1 Automating Regression Tests	687
B.4.2 Implementing a Tool for Regression Tests	692
B.4.3 Writing a Test Script	695
B.4.4 Verifying Output from Numerical Computations	696
B.4.5 Automatic Doc String Testing	700
B.4.6 Unit Testing	702
B.5 Version Control Management	704
B.5.1 Getting Started with CVS	705
B.5.2 Building Scripts to Simplify the Use of CVS	709
B.6 Exercises	709
